The Lebesgue number of a covering

Definition: Let $\mathcal{A}$ be an open covering of a metric space $X$. A Lebesgue number for $\mathcal{A}$ is a positive real number $\delta$ such that every subset $C$ of $X$ with diameter less than $\delta$ satisfies $C \subset A$ for some $A \in \mathcal{A}$.

Theorem: Every open covering of a compact metric space $(X, d)$ has a Lebesgue number.

Proof: Let $\mathcal{A}$ be an open covering of $X$. Each $x \in X$ belongs to some open set $A_x \in \mathcal{A}$, so there exists a $\delta_x > 0$ such that $B_d(x, \delta_x) \subset A_x$. The family $\{B_d(x, \delta_x/2) \mid x \in X\}$ is an open covering of $X$; let $\{B_d(x_i, \delta_{x_i}/2) \mid i = 1, \ldots, n\}$ be a finite subcovering, and define

$$\delta = \min_{1 \leq i \leq n} \frac{\delta_{x_i}}{2}.$$

We verify that $\delta$ is a Lebesgue number for $\mathcal{A}$. Let $C \subset X$ be a set with diameter less than $\delta$, and choose $x \in C$; then $x \in B_d(x_i, \delta_{x_i}/2)$ for some $i$, so that for any $y \in C$,

$$d(y, x_i) \leq d(y, x) + d(x, x_i) < \delta + \frac{\delta_{x_i}}{2} \leq \delta_{x_i}.$$

Thus $C \subset B_d(x_i, \delta_{x_i}/2) \subset A_{x_i}$. $\blacksquare$
