- 1 Shimura's concern: multivariate generalization of nearly holomorphic forms. Motivated the study of differential operators on a Hermitian symmetric space G/K .
- 2 Geometric Data: An irreducible Hermitian symmetric space G/K of rank n .
- 3 Algebraic Data: (Complexified) Lie algebra pair $(\mathfrak{g}, \mathfrak{k})$ admitting the *Harish-Chandra Decomposition*

$$\mathfrak{g} = \mathfrak{p}^- \oplus \mathfrak{k} \oplus \mathfrak{p}^+ (= \mathfrak{k} \oplus \mathfrak{p})$$

- \mathfrak{k} is the fixed point subalgebra of an involution θ .
- This $(-1, 0, 1)$ -grading (*short grading*) is given by the adjoint action of a suitable central element in \mathfrak{k} , corresponding to the complex structure of G/K , see [Hel01].

$\Lambda := \mathbb{C}[x_1, \dots, x_n]^{S_n \ltimes \mathbb{Z}_2^n}$ (ring of even symmetric polynomials)
 $\rho := (\rho_1, \dots, \rho_n)$, $\rho_i := \tau(n - i) + \alpha$. τ, α : parameters.

Theorem ([Oko98], [OO06], c.f.[SZ19])

The Okounkov polynomial $P_\mu(x; \tau, \alpha)$ is the unique polynomial in Λ satisfying

- 1** $\deg P_\mu = 2|\mu|$;
- 2** $P_\mu(\lambda + \rho) = 0$ for $\lambda \not\geq \mu$ [**the vanishing condition**];
- 3** *Some normalization condition.*

ρ can be specialized to the half sum of positive roots for a root system of Type BC . For the “usual” Type A symmetry, there are Knop–Sahi polynomials [KS96].

$\underline{\text{End}}(\mathbb{C}^{m|n})$ is a LSA denoted as $\mathfrak{gl}(m|n)$.

$\mathfrak{gl}_{\overline{0}}$: $\begin{pmatrix} A & 0 \\ 0 & D \end{pmatrix}$ preserves $|v|$. $\mathfrak{gl}_{\overline{1}}$: $\begin{pmatrix} 0 & B \\ C & 0 \end{pmatrix}$ reverses $|v|$.

$[X, Y] := XY - (-1)^{|X||Y|}YX$.

Bad news for general LSA

No Weyl's theorem on complete reducibility; Borels are not conjugates; *isotropic* (restricted) roots...

Theorem (We still have PBW)

Let \mathfrak{g} be a f.d. LSA and $\{x_i\}_{i=1}^n$ be a basis for \mathfrak{g} consisting of homogeneous elements. Then the following set of monomials is a basis for $\mathfrak{U}(\mathfrak{g})$

$$\{x_1^{k_1} \cdots x_n^{k_n}\}$$

where $k_i \in \mathbb{N}$ if $|x_i| = 0$ and $k_i \in \{0, 1\}$ if $|x_i| = 1$.

Now let's introduce the super twins for the superized problem. First, let $(\mathfrak{g}, \mathfrak{k})$ be a pair of complex Lie superalgebras so $\mathfrak{k} \subseteq \mathfrak{g}$.

Definition (Hermitian Symmetric Superpair)

If there is an element J in the center of \mathfrak{k} whose adjoint action gives the $(-1, 0, 1)$ -eigenspace decomposition and grading

$$\mathfrak{g} = \mathfrak{p}^- \oplus \mathfrak{k} \oplus \mathfrak{p}^+,$$

with $\mathfrak{p} = \mathfrak{p}^- \oplus \mathfrak{p}^+$, then we say $(\mathfrak{g}, \mathfrak{k})$ is a *Hermitian symmetric superpair*.

The \mathfrak{gl} -pair

Our discussion focuses on

$$\mathfrak{g} = \mathfrak{gl}(2p|2q), \mathfrak{k} = \mathfrak{gl}(p|q) \oplus \mathfrak{gl}(p|q)$$

with the following embedding of \mathfrak{k} into \mathfrak{g} .

$$\left(\left(\left(\begin{array}{c|c} A_{p \times p}^{(1)} & B_{p \times q}^{(1)} \\ \hline C_{q \times p}^{(1)} & D_{q \times q}^{(1)} \end{array} \right), \left(\begin{array}{c|c} A_{p \times p}^{(2)} & B_{p \times q}^{(2)} \\ \hline C_{q \times p}^{(2)} & D_{q \times q}^{(2)} \end{array} \right) \right) \right) \\ \mapsto \left(\begin{array}{cc|cc} A_{p \times p}^{(1)} & 0_{p \times p} & B_{p \times q}^{(1)} & 0_{p \times q} \\ 0_{p \times p} & A_{p \times p}^{(2)} & 0_{p \times q} & B_{p \times q}^{(2)} \\ \hline C_{q \times p}^{(1)} & 0_{q \times p} & D_{q \times q}^{(1)} & 0_{q \times q} \\ 0_{q \times p} & C_{q \times p}^{(2)} & 0_{q \times q} & D_{q \times q}^{(2)} \end{array} \right)$$

Here \mathfrak{p}^+ (resp. \mathfrak{p}^-) consists of matrices with non-zero entries only in the upper right (resp. bottom left) sub-blocks in each of the four blocks.

The \mathfrak{gl} -pair

The involution θ can be given by $\text{Ad exp}(i\pi J)$ with

$$J = \frac{1}{2} \left(\begin{array}{cc|cc} I_{p \times p} & & & \\ & -I_{p \times p} & & \\ \hline & & I_{q \times q} & \\ & & & -I_{q \times q} \end{array} \right)$$

Observe that J is central in \mathfrak{k} , and the above decomposition is the eigenspace decomposition with respect to J , which also gives the short grading.

Indeed a Hermitian symmetric superpair.

- Σ : (restricted) root system
- ${}_0\Sigma$: set of *isotropic* roots
- W_0 : Weyl group generated by the even simple roots^{good roots}

We specialize the result to our pair as follows:

Theorem (Alldrige, [All12])

The kernel of Γ is $\mathfrak{k}\mathfrak{U} \cap \mathfrak{U}^{\mathfrak{k}}$ and the image of Γ is $J(\mathfrak{a})$, where

$$J(\mathfrak{a}) = \mathfrak{S}(\mathfrak{a})^{W_0} \bigcap_{\alpha \in {}_0\Sigma} J_\alpha.$$

All these J_α can be written out explicitly!

An action ([SV11]) of $\mathfrak{W} = W_0 \sqcup W_0 \times {}_0\mathcal{S}$ on \mathfrak{a}^* is given by (loosely speaking),

- 1 sending $* \in \text{Obj}(W_0)$ to the entire \mathfrak{a}^* , and W_0 acts on \mathfrak{a}^* as usual;
- 2 sending $\alpha \in \text{Obj}({}_0\mathcal{S}) = {}_0\Sigma$ to $\Pi_\alpha := \{\mu \in \mathfrak{a}^* : (\mu, \alpha) = 0\}$, and $\bar{\tau}_\alpha$ to $\tau_\alpha : \mu \mapsto \mu + \alpha$ in Π_α ;
- 3 making sure that W_0 's action and ${}_0\mathcal{S}$'s action are compatible.

Classically, the Cartan–Helgason Theorem characterizes spherical representations.

Cartan–Helgason

Given $\mathfrak{g} = \mathfrak{k} \oplus \mathfrak{a} \oplus \mathfrak{n}$, we extend \mathfrak{a} to a Cartan \mathfrak{h} of \mathfrak{g} . Then $\lambda \in \mathfrak{h}^*$ is the highest weight of an irr. f.d. spherical \mathfrak{g} -rep.

IF AND ONLY IF

$$\lambda(i(\mathfrak{h} \cap \mathfrak{k})) = 0 \text{ and } \lambda \text{ is integral.}$$

The second condition loosely translates to some “evenness” property. E.g. for $(\mathfrak{sl}(2), \mathfrak{so}(2) = \text{diag. Cartan} = \mathfrak{t})$, sphericity $\iff 0$ is a weight. This happens iff the highest \mathfrak{t} -weight is *even*!

In the super picture:

Theorem (Alldridge, [AS15])

Let V be a \mathfrak{g} -module of highest weight $\lambda \in \mathfrak{h} \supseteq \mathfrak{a}$. Then V is spherical if

- 1** λ satisfies the usual “evenness” condition; and
- 2** λ is high enough.

Super Case

In the super picture:

Theorem (Alldridge, [AS15])

Let V be a \mathfrak{g} -module of highest weight $\lambda \in \mathfrak{h} \supseteq \mathfrak{a}$. Then V is spherical if

- 1 λ satisfies the usual “evenness” condition; and
- 2 λ is high enough.

- 1 Sufficient but not necessary;
- 2 The high enough condition is a purely odd condition. Technical. Involves root multiplicities.
- 3 The trivial rep ($\lambda = 0$) is spherical, but is not high enough;

For $\lambda \in \mathcal{H}(p, q)$, this is NOT enough to deduce that each $V(\lambda^{\natural})$ is spherical!

Punchline 1: $V(\lambda^{\natural})$ is the irreducible quotient of $K(\check{\lambda})$.

Punchline 2: $K(\check{\lambda})$ is indeed quasi-spherical.

Only two possibilities for $\lambda = (a, 1^b) \in \mathcal{H}(1, 1)$ are present. We show when $b \neq a - 1$, $K(\check{\lambda})$ has a spherical vector that descends to $V(\lambda^{\natural})$. For $b = a - 1$, by studying “degree 2” operators in $\mathfrak{U}(\mathfrak{g})$, we prove that $K(\check{\lambda})$ is indeed quasi-spherical. The proof is computational. □

Thank you!
