#OK to post #Julian Herman, 10/4/21, Assignment 9

3) Find equilibrium points:  

$$x = K_{x}(1 \cdot x)$$

$$x - K_{x} + K_{x}^{2} = 0$$

$$x(1 - K(1 \cdot x)) = 0$$

$$x = 0 \quad 1 - K(1 \cdot x) = 0$$

$$x = 0 \quad 1 - K(1 \cdot x) = 0$$

$$x = 0 \quad 1 - K(1 - x) = 0$$

$$x = 1 - x$$

$$x = 1 - x$$
For  $x = 0$  to be stable,  $\int f'(x = 0) | \mathcal{L} |$ 

$$x = 0, \quad x = 1 - \frac{1}{K} = \frac{K - 1}{K}$$
For  $x = 0$  to be stable,  $\int f'(x = 0) | \mathcal{L} |$ 

$$x = 0, \quad x = 1 - \frac{1}{K} = \frac{K - 1}{K}$$
For  $x = 0$  to be stable,  $\int f'(x = 0) | \mathcal{L} |$ 

$$x = 0, \quad x = 1 - \frac{1}{K} = \frac{K - 1}{K}$$
For  $x = 0$  to be stable,  $\int f'(x = 0) | \mathcal{L} |$ 

$$x = 0, \quad x = 1 - \frac{1}{K} = \frac{K - 1}{K}$$
For  $X = 0$  to be stable  $f(x) = Kx - Kx^{2}$ 

$$f'(0) = K - \frac{2}{K} = K$$

$$\int K | \mathcal{L} | \text{ for } x = 0 \text{ to be stable}$$

$$= \sum Shite K must be between 1 and 4, \quad x = 0$$
will never be stable because:
$$|K| \mathcal{L} | \text{ is not frue for any 1 \le K \le 4}.$$

Check stability of 
$$x = \frac{K-1}{K}$$
:  
 $F'(x = \frac{K-1}{K}) = K-2K\left(\frac{K-1}{K}\right) = K-2(K-1) = 2-K$   
 $\left|2-K\right| < 1$  is when  $x = \frac{K-1}{K}$  is stable  
 $-1 < 2-K$ ;  $2-K < 1$   
 $K < 3$ ;  $1 < K$   
 $\Rightarrow x = \frac{K-1}{K}$  is stable for  $1 < K < 3$   
 $\Rightarrow$  Therefore, the first bifurcation point occurs  
at  $K = 3$ ; when the fixed point is no longer  
stable and the population oscillates between  
more than one value (in the K=3 (ase, it  
fluctualis between 2 values).
