Let  $\langle w \rangle_{hare}$  be the smallest nonnegative integer k such that hare<sup>k</sup>(w) is an identity word. Define  $\langle w \rangle_{tortoise}$  similarly.

Theorem (D., Kravitz, 2018)

For any integer  $n \ge 3$ , there exists a word  $\eta_n$  of length 2n + 1 such that

 $\langle \eta_n \rangle_{hare} = 2n - 2$  and  $\langle \eta_n \rangle_{tortoise} = n$ .

Let  $\langle w \rangle_{hare}$  be the smallest nonnegative integer k such that hare<sup>k</sup>(w) is an identity word. Define  $\langle w \rangle_{tortoise}$  similarly.

Theorem (D., Kravitz, 2018)

For any integer  $n \ge 3$ , there exists a word  $\eta_n$  of length 2n + 1 such that

$$\langle \eta_n \rangle_{hare} = 2n - 2$$
 and  $\langle \eta_n \rangle_{tortoise} = n$ .

#### Conjecture

If w is a word of length m, then

$$\langle w 
angle_{ extsf{hare}} - \langle w 
angle_{ extsf{tortoise}} \leq rac{m-5}{2}$$

and

$$\langle w 
angle_{hare} \leq 2 \langle w 
angle_{tortoise} - 2.$$
