Amanda Folsom and Ken Ono's Error Could Have (and Should Have!) been Discovered by Their Computers (in Less than Three Seconds!)

Shalosh B. EKHAD [1]

Experimental Mathematics giants, David Bailey and Jonathan Borwein, describe ([BB]) how the use of computers is revolutionizing doing mathematics. The most *obvious* and *trivial* use, that *even* "pure" mathematicians (like Amanda Folsom and Ken Ono) should be able to do, is the *empirical* checking of formulas and statements. Unfortunately, they don't. Frank Garvan (see [AGL]) discovered that the statement of Theorem 1.2 in [FO] is false as stated. You can't trust humans, they are such screw-ups! This prompted me to find out for myself.

Once the short Maple code (written in a few minutes by D. Zeilberger):

`http://www.math.rutgers.edu/~zeilberg/tokhniot/KenAmandaError` ,

is downloaded and read (or copied-and-pasted) into a Maple session, typing:

`CheckKenAmanda(507);` ,

returns (in less than three seconds!):

`false` .

(Note that $24 \cdot 507 - 1 = 23 \cdot (23)^2$, but $spt(507)$ is even).

The fascinating paper [AGL] contains a corrected statement of this theorm, and *much nicer* proofs (**not** using Maass forms, but rather elegant combinatorial arguments). It also describes how to fix the original proof of [F0].
