A One-Line Proof of Leversha's "Quartet of Isogonal Conjugates" Theorem

Shalosh B. EKHAD and Doron ZEILBERGER

In [L], Gerry Leversha spent quite a few pages, using human ingenuity and lots of previous knowledge, to prove the following elegant theorem (see [W] for the definition of *Isogonal Conjugate*).

Leversha's Quartet Theorem ([L]): Let ABCD be a quadrilateral which is not cyclic. Let A^* be the isogonal conjugate of A with respect to ΔBCD , and similarly let B^* , C^* , D^* the isogonal conjugates of ΔADC , ΔABD , ΔABC respectively. Then A,B,C, and D are the circumcenters of $\Delta B^*C^*D^*$, $\Delta A^*C^*D^*$, $\Delta A^*D^*D^*$, and $\Delta A^*C^*B^*$.

Proof: Download the Maple package RENE.txt freely available from Doron Zeilberger's website https://sites.math.rutgers.edu/~zeilberg/PG/RENE.txt , start Maple, and type read 'RENE.txt': followed by Leversha();, and in **one nano-second**, you would get that it is true. The Maple code for proving Leversha's theorem is as follows:

$$T1 := Te(m, n); T2 := Te(m1, n1); A := [0, 0]; B := T1[3]; C := T2[3];$$

 $evalb(DeSq(IsogonalConjugate(m1, n1, B), A) = DeSq(IsogonalConjugate(m, n, C), A));$

Explanation

Without loss of generality (by translating, rotating, and shrinking) we can assume that A = (0,0), D = (1,0),

$$\tan(\frac{1}{2}\angle BAD) = m \quad , \quad \tan(\frac{1}{2}\angle ADB) = n \quad , \quad \tan(\frac{1}{2}\angle CAD) = M \quad , \quad \tan(\frac{1}{2}\angle ADC) = N \quad ,$$

so now $\triangle ADB$ and $\triangle ADC$ are what are called (in RENE.txt), Te(m,n) and Te(M,N). Using the straightforward IsogonalConjugate macro we get B^* and C^* and we just check that the 'distance-squared' (DeSq), between A and B^* and A and C^* are the same. Of course, this is also true about the distance between A and B^* and A and D^* , and by the transitivity of the = relation, all three distances are equal and hence indeed A is the circumcenter of $\triangle B^*C^*D^*$.

But using this 'analytic' approach (rather than Leversha's *synthetic* approach) gives much more. LevershaRadius(m,n,M,N) gives that the exact value of the circumradius of $\Delta B^*C^*D^*$ is

$$\frac{\left(N-n\right)\left(Nn+1\right)\left(m^{2}+1\right)\left(M^{2}+1\right)}{\left((MN-1)(mn-1)+(M+N)(n+m)\right)\left(MN(n+m)-mn(M+N)+M+N-m-n\right)}$$

RENE.txt can also tell you the exact locations of B^* and C^* :

$$B^* = \left(\frac{(Mm + M - m + 1)(Mm - M + m + 1)(Nn + 1)(N - n)}{(MN(mn - 1) + (M + N)(m + n) - mn + 1)(MN(m + n) - mn(M + N) + M + N - m - n)}\right),$$

$$\frac{2 (N n+1) (N-n) (M m+1) (M-m)}{(M N (m n-1)+(M+N) (m+n)-m n+1) (M N (m+n)-m n (M+N)+M+N-m-n)}) ,$$

$$C^* = \left(\frac{(Mm + M - m + 1)(Mm - M + m + 1)(Nn + 1)(N - n)}{(MN(mn - 1) + (M + N)(m + n) - mn + 1)(MN(m + n) - mn(M + N) + M + N - m - n)}, - \frac{2(Nn + 1)(N - n)(Mm + 1)(M - m)}{(MN(mn - 1) + (M + N)(m + n) - mn + 1)(MN(m + n) - mn(M + N) + M + N - m - n)}\right).$$
