Relational
Complexity

Binary Affine
Groups

- Can we do something with finite homogeneous structures in a relational language of bounded complexity?

1 Origins

2 Relational Complexity

3 Binary Affine Groups

The meaning of relational complexity

Definition

$$a \sim b \iff b \in G \cdot a \quad (1)$$

$$a \sim_k b \iff a_I \sim b_I \text{ for } |I| = k \quad (2)$$

$$\rho(G, X) = \min(k \mid a \sim_k b \implies a \sim b) \quad (3)$$

I feel this is a **natural**, and perhaps even **fundamental**, invariant.

The meaning of relational complexity

Definition

$$a \sim b \iff b \in G \cdot a \quad (1)$$

$$a \sim_k b \iff a_I \sim b_I \text{ for } |I| = k \quad (2)$$

$$\rho(G, X) = \min(k \mid a \sim_k b \implies a \sim b) \quad (3)$$

Example

$$\text{GL}(V)_{\text{nat}}: \begin{cases} d + 1 & \text{if } F \neq \mathbb{F}_2 \\ \text{else } d \end{cases}$$

The meaning of relational complexity

Definition

$$a \sim b \iff b \in G \cdot a \quad (1)$$

$$a \sim_k b \iff a_l \sim b_l \text{ for } |I| = k \quad (2)$$

$$\rho(G, X) = \min(k \mid a \sim_k b \implies a \sim b) \quad (3)$$

Example

$$\text{GL}(V)_{\text{nat}}: \begin{cases} d + 1 & \text{if } F \neq \mathbb{F}_2 \\ \text{else } d \end{cases}$$

Because $(e, \lambda(e)) \sim_d (e, \lambda'(e))$

The meaning of relational complexity

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

Definition

$$a \sim b \iff b \in G \cdot a \quad (1)$$

$$a \sim_k b \iff a_l \sim b_l \text{ for } |l| = k \quad (2)$$

$$\rho(G, X) = \min(k \mid a \sim_k b \implies a \sim b) \quad (3)$$

Example

$$\text{GL}(V)_{\text{nat}}: \begin{cases} d + 1 & \text{if } F \neq \mathbb{F}_2 \\ \text{else } d \end{cases}$$

Because $(e, \lambda(e)) \sim_d (e, \lambda'(e))$

$\rho \approx$ dimension?

Relational complexity and computational complexity

Example

$$\mathrm{GL}(V)_{\mathrm{nat}}: \begin{cases} d + 1 & \text{if } F \neq \mathbb{F}_2 \\ \text{else } d \end{cases}$$

$$\mathrm{Sym}_n \text{ on } \begin{bmatrix} n \\ k \end{bmatrix}: \lfloor \ln_2 k \rfloor + 2;$$

$$\mathrm{Alt}(n) \text{ on } \begin{bmatrix} n \\ k \end{bmatrix}: n - 3 \quad (k \geq 3, 2k + 2 \neq n)$$

$$\rho_S(n, k) \approx \ln_2 k;$$

$$\rho_A(n, k) \approx n - 3$$

Relational complexity and computational complexity

Example

$$\mathrm{GL}(V)_{\mathrm{nat}}: \begin{cases} d + 1 & \text{if } F \neq \mathbb{F}_2 \\ \text{else } d \end{cases}$$

$$\mathrm{Sym}_n \text{ on } \begin{bmatrix} n \\ k \end{bmatrix}: \lfloor \ln_2 k \rfloor + 2;$$

$$\mathrm{Alt}(n) \text{ on } \begin{bmatrix} n \\ k \end{bmatrix}: n - 3 \quad (k \geq 3, 2k + 2 \neq n)$$

$$\rho_S(n, k) \approx \ln_2 k;$$

$$\rho_A(n, k) \approx n - 3$$

Base: minimal set with trivial stabilizer.

The base bounds the complexity of group elements; the relational complexity bounds the complexity of the action.

GLUCK-SERESS-SHALEV 1998 Base size is **bounded** as a function of complexity of composition factors (e.g., 4 in the solvable case).

Binary Affine
Groups

Theorem

An affine primitive binary group (G, V) is either a p -cycle or affine space with an anisotropic quadratic form.

Remark

$G = V.H$, V acts by translation and H acts linearly.

Target $H = O^-(\mathbb{F}_{q^2})$ with quadratic form $N_{q^2/q}$ (dihedral).

Outline of Proof.

- H is solvable
- H embeds into a 1-dimensional semilinear group $\Gamma(1, \mathbb{F})$
- $\mathbb{F} = \mathbb{F}_{q^2}$, $H = K \cdot \langle \sigma \rangle$, $K = \ker N$

The 1-dimensional semilinear case, $G \leq AGL(1, \mathbb{F})$,
 $\mathbb{F}_+ \leq G$; $G \not\leq \mathbb{F}_+ \cdot \langle \pm 1 \rangle$

- G is generated by involutions

$G \leq \mathbb{F}_+ \cdot K \cdot \langle \sigma \rangle$, $G = \mathbb{F}_+ \cdot X \cdot \langle a\sigma \rangle$ Take $a = 1$ for simplicity.

$c \in K$: $u^\sigma = uc$ (Theorem 90)

$k \neq \pm 1$ in X

$$0, u, (1+k)u \quad \sim_2 \quad 0, u, (1+k^{-1})u$$

Identification

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

The 1-dimensional semilinear case, $G \leq AGL(1, \mathbb{F})$,
 $\mathbb{F}_+ \leq G$; $G \not\leq \mathbb{F}_+ \cdot \langle \pm 1 \rangle$

- G is generated by involutions

$G \leq \mathbb{F}_+ \cdot K \cdot \langle \sigma \rangle$, $G = \mathbb{F}_+ \cdot X \cdot \langle a\sigma \rangle$ Take $a = 1$ for simplicity.

$c \in K$: $u^\sigma = uc$ (Theorem 90)

$k \neq \pm 1$ in X

$$0, u, (1+k)u \sim_2 0, u, (1+k^{-1})u$$

The conjugating element must be $c\sigma$ as u is fixed. So $c \in G$.

Solvable case

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

Induction:

1, $G = VH$, $K \triangleleft H$, V_0 K -irreducible.

Then $\rho(V_0 N_H(V_0)) \leq \rho(G)$

2. K elementary abelian 2-group, $V = \bigoplus V_\lambda$ weight spaces.

Then $\rho(V_\lambda N(V_\lambda)) \leq \rho(G)$

(The restricted group is primitive in both cases.)

Solvable case

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

Induction:

1, $G = VH$, $K \triangleleft H$, V_0 K -irreducible.

Then $\rho(V_0 N_H(V_0)) \leq \rho(G)$

2. K elementary abelian 2-group, $V = \bigoplus V_\lambda$ weight spaces.

Then $\rho(V_\lambda N(V_\lambda)) \leq \rho(G)$

(The restricted group is primitive in both cases.)

A more technical lemma in this spirit ...

Normalization lemma

Lemma (Main Lemma)

Let $G = VH$ affine and binary. Let $K \triangleleft H$, $W \leq V$ an irreducible K -submodule.

$t \in G$ is an involution; $k \in K$, $v \in W$ with

$$v^k \neq \pm v, \quad v^t - v \sim v^{kt} - v^k \text{ under } H \text{ (e.g., } k, t \text{ commute)}$$

Then $W^t = W$.

Normalization lemma

Lemma (Main Lemma)

Let $G = VH$ affine and binary. Let $K \triangleleft H$, $W \leq V$ an irreducible K -submodule.

$t \in G$ is an involution; $k \in K$, $v \in W$ with

$$v^k \neq \pm v, \quad v^t - v \sim v^{kt} - v^k \text{ under } H \text{ (e.g., } k, t \text{ commute)}$$

Then $W^t = W$.

Proof.

$$(u_1, u_2, u_3, u_4) = (0, v + v^k, v + v^t, v^k + v^t), \quad u'_4 = v + v^{kt}.$$

$$(u_1, u_2, u_3, u_4) \sim (u_1, u_2, u_3, u'_4)$$

— but $u_2 \in W$, $u_3 - u_4 \in W$, $u_3 - u'_4 \in W^t$.

Toward Solvability

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

$$G = VH$$

Target: $EG = 1$ (no nontrivial quasisimple factor)

- Char 2:

- Torsion: no elements of order 4
- (Bender) $H = \text{PSL}_2, J_1, \text{ or } {}^2G_2$
- Eliminate via action of Borel subgroup and induction

- Odd char:

- Torsion: no p -elements, complete reducibility
- Exclude Q_8, Alt_4
- $L \triangleleft EG$: PSL_2 or 2B_2
- Weight spaces V_λ for max el. abelian 2-group E :
 $u_\lambda^g = f(\lambda)u_\lambda$
- $N_G(E)$ -orbits on Λ length at most 2
- $EG = 1$

Problems

Finite Binary
Homogeneous
Structures

Gregory
Cherlin

Origins

Relational
Complexity

Binary Affine
Groups

- **Computational complexity** of $\rho(G, X)$ in the primitive case, and in general.
- Qualitative theory of primitive **k -ary** groups (including the binary non-affine case)
 - Lower bounds on ρ for most OS-types, reducing to affine and almost simple cases (WISCONS, in progress)
 - Affine case: More representation theory
 - Almost simple case: Aschbacher classification should reduce to **small** maximal subgroups
 - Estimate ρ for classical actions.
- **Imprimitive case** (model theory)??
