Conjecture (Algebraicity)

G : *finite Morley rank, connected.*

H : *maximal connected solvable normal, definable.*

$$1 \rightarrow H \rightarrow G \rightarrow \bar{G} \rightarrow 1$$

\bar{G} : *a central product of algebraic groups.*

Equivalently: The simple groups are algebraic.

t and T

We want to show that a large degree of generic transitivity (t large) blows up $rk(T/T_\infty)$ for T the definable hull of a 2-torus.

Let us simplify considerably.

The group G will induce the action of Sym_t on any t independent generic points.

Trading T in for a smaller torus, and trading t in for a smaller value as well (but not too small) we can set this up so that we have:

- a finite group Σ operating on T , and
- covering Sym_t , and
- sitting inside a connected group H such that
- T is the definable hull of a maximal 2-torus in H .

Plugging a hole

The Setup

T inside G , G connected, Sym_t acts on T , t large, and T is the definable hull of a maximal 2-torus.

The problem:

Connected
Groups of
Finite Morley
Rank

Gregory
Cherlin

I. Structure

Essential Notions
Algebraicity and
Structure

II. Geometry

Good Tori
Carter subgroups

III. Application

Generic F -transitivity
Lower bounds for T

Desiderata

Plugging a hole

The Setup

T inside G , G connected, Sym_t acts on T , t large, and T is the definable hull of a maximal 2-torus.

The problem: if Sym_t acts trivially on T , then this says **nothing**.

Plugging a hole

The Setup

T inside G , G connected, Sym_t acts on T , t large, and T is the definable hull of a maximal 2-torus.

The problem: if Sym_t acts trivially on T , then this says **nothing**.

However: at this point G can again be taken to be simple (via MPOSA) and therefore a dichotomy applies:

- Either G is algebraic or
- G contains no unipotent 2-subgroup.

However: at this point G can again be taken to be simple (via MPOSA) and therefore a dichotomy applies:

- Either G is algebraic or
- G contains no unipotent 2-subgroup.

In the former case, we can trade 2 off for a prime different from the characteristic and use the bound on $rk(T/T_\infty)$ to control the rank of G —structure theory.

In the latter case, recall that **2-elements in the centralizer of T belong to T** . It follows easily that the action of Sym_t on T is **faithful**.

And so, we are done!

Desiderata

- The original goal: a list of “intractable” minimal configurations.
I would like to see that in final form!
- Better bounds on primitive permutation groups, particularly in the algebraic case.
Popov in characteristic 0, with algebraic actions.
- L -group theory for odd type groups.
Frécon perhaps, in his work on conjugacy of Carter subgroups.
