

6 If $|z| = R$ where R is a large positive number, then the “reverse triangle inequality” applied to the original formula for f allows us to underestimate the denominator of $|f(z)|$ in terms of R (note that there will be several expressions that are subtracted):

So the denominator of $|f(z)| \geq$ _____.

7 The length of S_R is _____. The ML inequality allows us to overestimate the modulus of $\int_{S_R} f(z) dz$ in terms of R .

$$\left| \int_{S_R} f(z) dz \right| \leq \underline{\hspace{2cm}}.$$

8 We therefore conclude that $\lim_{R \rightarrow \infty} \int_{S_R} f(z) dz =$ _____.

9 Combine the results of **8** and **5** to compute the value of $\lim_{R \rightarrow \infty} \int_{I_R} f(z) dz$.

The value of this limit is _____.

10 Putting it all together, we finally can write

$$\int_{-\infty}^{\infty} \frac{1}{x^2 + x + 1} dx = \underline{\hspace{2cm}}.$$

Maple reports that this quantity is approximately 3.62759 87284 68435 7012.
