

### The Pigeon-Hole Principle

1. Let  $A$  be a subset of integers of size  $n$ . Prove that there is a nonempty subset of  $A$  whose sum is divisible by  $n$ .
2. Given 19 distinct integers from the arithmetic progression  $1, 4, 7, \dots, 100$ , prove that there must be two distinct integers that sum to 104.
3. Let  $q$  be an odd integer greater than 1. Show that there is an integer  $n$  such that  $q$  divides  $2^n - 1$ .
4. Let  $A = \{1, 2, 3, \dots, 100\}$ . Let  $B \subseteq A$  be such that for all distinct  $x, y \in B$ ,  $x + y$  is not divisible by 11. Show that  $|B| \leq 47$ .
5. Let  $A$  be a subset of size  $n + 1$  consisting of positive integers in the range 1 to  $2n$ . Prove that there must be distinct elements  $a, b$  of  $A$  such that  $a$  is a divisor of  $b$ .
6. For any positive integer  $n$ , if  $S$  is a set of  $2^n + 1$  points  $\mathbb{R}^n$  with integer coordinates. Then there exists two of the points such that the midpoint of the segment between them has all integer coordinates.
7. Suppose we have 25 points inside a regular hexagon of side-length 2. Show that some two of them are within distance 1 of each other.
8. Let  $X$  be a real number and  $n$  a positive integer. Prove that at least one of the numbers  $X, 2X, \dots, nX$  is within  $1/(n + 1)$  of an integer.
9. Let  $A$  be a finite subset of positive integers of size  $n$ . Let  $a_1, a_2, \dots, a_t$  be a sequence of integers each belonging to  $A$ . Prove that if  $t \geq 2^n$  then there are integers  $j, k$  satisfying  $1 \leq j \leq k \leq n$  such that  $\prod_{i=j}^k a_i$  is a perfect square.
10. Suppose  $S$  is a subset of  $\{1, 2, \dots, 2n + 1\}$  such that for any two distinct elements  $a, b \in S$ , their sum  $a + b$  is *not* in  $S$ . Show that  $|S| \leq n + 1$ .
11. Let  $M$  be a matrix of real numbers, with each row in nondecreasing order. Suppose we sort each column into nondecreasing order. Prove that the rows are still in nondecreasing order.
12. Suppose 6 circles have a point in common. Prove that one of the circles contains the center of another circle.
13. Let  $B$  be a subset of  $\{-1, 1\}^n$  (the set of points in  $\mathbb{R}^n$  with all coordinates equal to  $-1$  or  $+1$ ). If  $|B| > 2^{n+1}/n$ , prove that  $B$  contains a set of three points that are the vertices of an equilateral triangle.
14. Let  $m, n$  be positive integers. Suppose  $x_1, \dots, x_m$  are positive integers between 1 and  $n$  and  $y_1, \dots, y_n$  are positive integers between 1 and  $m$ . Prove that there is a nonempty subsequence of consecutive entries of  $x_1, \dots, x_m$  and a nonempty subsequence of consecutive entries of  $y_1, \dots, y_n$  that have the same sum.

15. (Somewhat difficult) Let  $A, B$  be integer 2 by 2 matrices. Suppose that each of the matrices  $A, A + B, A + 2B, A + 3B, A + 4B$  has the property that it is invertible and its inverse has integer entries. Prove that  $A + 5B$  has the same property.
