**Problem 1.** Prove that if  $A \sim B$  and  $B \sim C$  then  $A \sim C$ .

**Solution.** Let  $f : A \rightarrow B$  and  $g : B \rightarrow C$  be bijections witnessing that  $A \sim B$  and  $B \sim C$ . WTP there is a bijection  $h : A \rightarrow C$ . Define  $h = g \circ f$ , we have proved that the composition of bijections is a bijection,

**Problem 2.** Prove the following items:

1.  $\mathbb{N} \setminus \{2023, 2024\} \sim \mathbb{N}_{\text{even}}$ .

**Solution.** Define  $f : \mathbb{N}_{\text{even}} \rightarrow \mathbb{N} \setminus \{2023, 2024\}$  by  $f(n) = \begin{cases} \frac{n}{2} & n < 4046 \\ \frac{n+4}{2} & n \geq 4046 \end{cases}$

2.  $P(\mathbb{N}) \setminus \{\emptyset\} \sim P(\mathbb{N})$ .

**Solution** Define  $f : P(\mathbb{N}) \setminus \{\emptyset\} \rightarrow P(\mathbb{N})$ , by  $f(X) = \begin{cases} \emptyset & X = \{0\} \\ \{\min(X) - 1\} & |X| = 1 \wedge \min(X) > 0 \\ X & \text{otherwise} \end{cases}$

3.  $(0, 1) \sim (0, \infty)$ .

**Solution.** Define  $f : (0, 1) \rightarrow (0, \infty)$  by  $f(x) = \frac{1}{x} - 1$

4.  $\mathbb{Z} \times [0, 1) \sim \mathbb{R}$ .

**Solution.** Define  $f : \mathbb{Z} \times [0, 1) \rightarrow \mathbb{R}$  by  $f(z, r) = z + r$ .

In all the above solutions you need to prove that the functions defined are bijections.

MATH 300

---

**Problem 3.** Prove that for every  $\alpha < \beta$  real numbers  $(\alpha, \beta) \approx (0, 1)$ . [Hint: First stretch/shrink  $(0, 1)$  to have length  $\beta - \alpha$ , then shift it by  $+c$  as we did in class.]

**Solution.** Define  $f : (0, 1) \rightarrow (\alpha, \beta)$  by  $f(x) = (\beta - \alpha)x + \alpha$ . Then  $f$  is a bijection and the inverse function is  $g : (\alpha, \beta) \rightarrow (0, 1)$  defined by  $g(y) = \frac{y - \alpha}{\beta - \alpha}$ .

MATH 300

---

**Problem 4.** Show that  $\mathbb{N}\{0, 1\} \times \mathbb{N}\{0, 1\} \approx \mathbb{N}\{0, 1\}$ .

[Hint: Use the interleaving function  $F : (\mathbb{N}\{0, 1\})^2 \rightarrow \mathbb{N}\{0, 1\}$  defined by

$$F(\langle f, g \rangle)(n) = \begin{cases} f(\frac{n}{2}) & n \in \mathbb{N}_{\text{even}} \\ g(\frac{n-1}{2}) & n \in \mathbb{N}_{\text{odd}} \end{cases}$$

as the witnessing bijection.]

**solution.** Let us prove that it is one-to-one, Suppose that  $F(\langle f, g \rangle) = F(\langle f', g' \rangle)$ , this is a function equality and therefore for every  $n$ ,  $F(\langle f, g \rangle)(n) = F(\langle f', g' \rangle)(n)$ . We want to prove that  $f = f'$  and  $g = g'$ . Let  $n \in \mathbb{N}$ ,

$$f(n) = F(\langle f, g \rangle)(2n) = F(\langle f', g' \rangle)(2n) = f'(n)$$

and therefore  $f = f'$ , similarly, let  $n \in \mathbb{N}$  then

$$g(n) = F(\langle f, g \rangle)(2n + 1) = F(\langle f', g' \rangle)(2n + 1) = g'(n)$$

Let us prove that  $F$  is onto. Let  $h : \mathbb{N} \rightarrow \{0, 1\}$  be any function, we need to find  $\langle f, g \rangle$  such that  $F(\langle f, g \rangle) = h$ . Define  $f(n) = h(2n)$  and  $g(n) = h(2n + 1)$ , then it is not hard to show that  $F(\langle f, g \rangle)(n) = h(n)$  for every  $n$  and therefore  $F(\langle f, g \rangle) = h$ .
