with an attachment hw5FirstLast.pdf

1. a. Convert the recurrence

$$6a(n-1) + a(n+3) + 5a(n+1) = 0 \quad ,$$

into **standard form** where $a(n+4)$ is expressed in terms of $a(n+3), a(n+2), a(n+1), a(n)$.

b.

Abbreviating

$$\mathbf{a}(n) = \begin{bmatrix} a(n+3) \\ a(n+2) \\ a(n+1) \\ a(n) \end{bmatrix} .$$

Find the 4×4 matrix, let's call it A such that

$$\mathbf{a}(n+1) = A\mathbf{a}(n)$$

c Assuming that $a(0) = 0, a(1) = 2, a(2) = 3, a(3) = 4$ Find $a(5)$ in two ways:

(i) Straight from the standard form, by first finding $a(4)$, and then $a(5)$

(ii) Using the matrix version by first finding A^2 and then multiplying it by the column vector $[4, 3, 2, 0]^T$ and extracting the first component.

2. In a certain species only one-year-olds, two-year-olds, three-year-olds, and four-year-olds are fertile. We have

- zero-year-olds can't have babies
- Every 1-year-old female makes 1.5 babies on average
- Every 2-year-old female makes 0.9 babies on average
- Every 3-year-old female makes 0.5 babies on average

- Every 4-year-old female makes 0.3 babies on average

We also know

- The probability that a zero-year-old will survive the year is 0.8
- The probability that a one-year-old will survive the year is 0.7
- The probability that a two-year-old will survive the year is 0.6
- The probability that a three-year-old will survive the year is 0.6

a. Set up the **Leslie matrix**

b. If right now there are 100 zero-year-olds, 90 one-year-olds, 80 two-year-olds, 70 three-year-olds, and 60 four-year-old, what is the expected number of 3-year-olds after two years?

Daniyal Chaudhry HW5

1) a) $6a(n-1) + a(n+3) + 5a(n+1) = 0 \Rightarrow 6a(n) + a(n+4) + 5a(n+2) = 0$
 $a(n+4) = 0 \cdot a(n+3) - 5a(n+2) + 0 \cdot a(n+1) - 6a(n)$

b) $A = \begin{bmatrix} 0 & -5 & 0 & -6 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$ fills $\vec{a}(n+1) = A\vec{a}(n)$

c) $a(0) = 0, a(1) = 2, a(2) = 3, a(3) = 4$

i) $a(4) = -5a(2) - 6a(0) = -5(3) - 6(0) = -15 \rightarrow$ wasn't finding $a(4)$ unnecessary
 $a(5) = -5a(3) - 6a(1) = -5(4) - 6(2) = \boxed{-32}$

ii) $\begin{bmatrix} 0 & -5 & 0 & -6 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}^2 = \begin{bmatrix} -5 & 0 & -6 & 0 \\ 0 & -5 & 0 & -6 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} 4 \\ 3 \\ 2 \\ 0 \end{bmatrix}$ (we only want first component): $-20 - 12 = \boxed{-32}$

2. $f_0 = 0, f_1 = 1.5, f_2 = 0.9, f_3 = 0.5, f_4 = 0.3$
 $p_0 = 0.8, p_1 = 0.7, p_2 = 0.6, p_3 = 0.6$

a) $L = \begin{bmatrix} 0 & 1.5 & 0.9 & 0.5 & 0.3 \\ 0.8 & 0 & 0 & 0 & 0 \\ 0 & 0.7 & 0 & 0 & 0 \\ 0 & 0 & 0.6 & 0 & 0 \\ 0 & 0 & 0 & 0.6 & 0 \end{bmatrix}$

b) The expected # of 3 year olds after 2 years is influenced by the number of 1 year olds now:

① 90 one yos w/ 0.7 survivability = 63

② 63 two yos w/ 0.6 survivability = $\boxed{37.8}$
