

Section 7 : 7.1, 7.2, 7.3, 7.4, 7.5, 7.6, 7.7

7.1) Which of the following graphs are Hamiltonian? Semi-Hamiltonian?

(i) The complete graph  $K_5$  : Hamiltonian

(ii) The complete bipartite graph  $K_{2,3}$

$n=5$   
 $\deg(b) + \deg(a) = 6$   
 $\deg(a) + \deg(c) = 4 \times$   
 NON HAMILTONIAN!  
 SEMI-HAMILTONIAN (See pink path)

(iii) The graph of the octahedron

$n=6$  Since every vertex has  $\deg=4$ , any two vertices' degrees added will be  $8 \geq 6$ , so HAMILTONIAN

(iv) The wheel  $W_6$

Hamiltonian

(v) The 4-cube  $Q_4$

Hamiltonian

7.2) In the table of Fig 2.9, locate all Hamiltonian and Semi-Hamiltonian graphs.

Hamiltonian: 1, 4, 8, 9, 10, 18, 22, 26, 27, 28, 29, 30, 31

Semi-Hamiltonian: 2, 3, 6, 7, 13, 15, 16, 17, 19, 20, 23, 24, 25

7.3)

(i) For which values of  $n$  is  $K_n$  Hamiltonian?

When  $n > 2$ .

(ii) Which complete Bipartite graphs are Hamiltonian?

$K_{s,t}$  is Hamiltonian if  $s, t > 1$  and  $s=t$ .

(iii) Which Platonic graphs are Hamiltonian?

They are all Hamiltonian.

(iv) For which values of  $n$  is the wheel  $W_n$  Hamiltonian.

The wheel  $W_n$  is Hamiltonian whenever it is a valid wheel ( $n > 2$ ).

(v) For which values of  $k$  is the  $k$ -cube Hamiltonian?

When  $k > 1$ .

7.4) Show that the Grötzsch graph is Hamiltonian

There is a Hamiltonian cycle, therefore Hamiltonian.

7.5)

(i) Prove that if  $G$  is a bipartite graph with an odd number of vertices, then  $G$  is non-hamiltonian:

Say  $G$  is a bipartite graph with an odd number of vertices. Then, for  $k \neq t$ ,  $s \neq t$  since if it was,  $k$  would have an even number of vertices (if  $s=t$ , odd + odd = even or even + even = even). Since  $s \neq t$ , and all vertices in  $s, t$  are non-adjacent, we must jump from one set to another in the creation of our path (no other way) and we will end up in the larger set either with unvisited vertices in the larger set (we can't use the smaller set's vertices anymore since all of our vertices have been visited) or no ability to go back to the vertex we started on since we're in the disjoint set that includes the starting vertex.

(ii) Deduce that  $\mathbb{Z}_7$  is non-hamiltonian:

Since a Hamiltonian cycle DNE, non-hamiltonian!

(iii) Show if  $n$  is odd, not possible for a knight to visit all squares of an  $n \times n$  chessboard exactly once by knight's moves & return to its starting point.

if  $n$  is odd, since a knight moves in "L" shape, which is two  $\rightarrow$  down or two left/right and one  $\rightarrow$  down or one left/right,

there will be pieces never reached in the center as can be seen by this  $3 \times 3$ .

7.6) Show that  $\deg(v) \geq n/2$  can't be replaced with  $\deg(v) \geq \frac{(n-1)}{2}$

7.7)

(i) Let  $G$  be a graph with  $n$  vertices and  $\lfloor \frac{(n-1)(n-2)}{2} \rfloor + 2$  edges.

That's  $\frac{n^2}{2} - \frac{3n}{2} + 3$  edges. Recall the complete

graph with  $n$  vertices has  $\frac{(n)(n-1)}{2} = \frac{n^2}{2} - \frac{n}{2}$

edges. So, the complete graph has

$n-3$  more edges. Also, the complete

graph has, for any vertex,  $\deg(v) = n-1$ .

Say you take  $n-3$  edges out of

any vertex pair from  $K_n$ . Even if you

take every edge out of a single pair,

you still have  $(n-1) + (n-1) - (n-3) = n+1$  degree

in every pair of non-adj vertices (at least).

(ii)

$$n=5$$

$$\frac{(n-1)(n-2)}{2} + 1 = 7$$
