

1.  $\begin{pmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \end{pmatrix} \rightarrow$  number of inversions: 0  
 $\begin{pmatrix} 1 & 2 & 3 \\ 2 & 3 & 1 \end{pmatrix} \rightarrow$  number of inversions: 1  
 $\begin{pmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \end{pmatrix} \rightarrow$  number of inversions: 3  
 $\begin{pmatrix} 1 & 2 & 3 \\ 1 & 3 & 2 \end{pmatrix} \rightarrow$  number of inversions: 1  
 $\begin{pmatrix} 1 & 2 & 3 \\ 2 & 1 & 3 \end{pmatrix} \rightarrow$  number of inversions: 1  
 $\begin{pmatrix} 1 & 2 & 3 \\ 3 & 1 & 2 \end{pmatrix} \rightarrow$  number of inversions: 2

2.  $(1523746)$  - inversions:  $(52, 53, 54, 74, 76)$   
 number of inversions: 6

3. It is not possible because the taxicab distance stays the same, but the number of inversions is 1. However, with each move, the invariant (taxicab distance + # of inversions) changes by an even number. So, it is not possible to have a legal move which leads to the image.

4. A group is a set of objects that have a property of "multiplication" such that for any elements  $f$  and  $g$ ,  $f * g$  is an element of the group. There is an identity element, denoted  $e$ , such that for any element  $f$ ,  $f * e = f$  and  $e * f = f$ .

All elements have an inverse denoted  $f^{-1}$  such that  $f * f^{-1} = e$  and  $f^{-1} * f = e$ .

There is associativity, for any elements  $f, g, h$ ,  $f * (g * h) = (f * g) * h$ .

5. (i) The identity element is  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

(ii) To find the inverse of matrix  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

$A^{-1} = \frac{1}{ad-bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$ , and it is a part of the group because  $\det A^{-1} = \frac{1}{ad-bc} (da-bc) = 1$
